The amount of residue is much the greatest after a dry season, which has retarded the nitrification and distribution of the nitrogen of the ammonia. The facts now mentioned show a greater effect of residues from ammonia salts than of residues from nitrate of soda; a greater amount of residue in barley than in wheat culture; and a much greater residue at Woburn than at Rothamsted. Can we explain these facts? The far greater unused residue remaining in the soil after the growth of a crop with ammonia salts at Woburn than appears in the Rothamsted experiments is surely connected with the much later date at which the ammonia is applied at Woburn, and with the poverty...
